Did you know?

Hearing loss is a major public health issue affecting 15% of the world's adult population* and a third of over 65 year olds.** This means a significant number of **your potential customers** have **difficulty interacting with you**.

Why is hearing loss a problem in everyday life?

Conversations should be easy and natural. But instead, for those with hearing loss, it becomes a stressful activity which causes fatigue and embarrassment. If your customers cannot hear what your staff are saying, your company becomes difficult to do business with. Many customers with hearing loss even choose to avoid places that are poorly provisioned. **If your business provokes uncomfortable situations for customers, the impact could be severe.**

*WHO estimate for 2011. **WHO Fact Sheet No. 300, March 2015.

Why should you improve your accessibility?

People are beginning to speak up and **demanding a better experience**. In order to keep up with other customer-focused service providers and fully comply with the Equality Act 2010 and the BS8300 standard, **accessibility needs to be your top priority**.

Don't get left behind!

Technology can be put in place which allows you to realise the full potential of every interaction, **leading to happier customers and an enhanced reputation**.

How does a loop transform your customers' experience?

In normal mode, a hearing aid amplifies all sounds, including any background noise. In busy environments this can make it **very tricky for those with hearing loss to distinguish speech or conversation.**

Hearing loop systems overcome this problem.

Speech is picked up through a microphone, converted to magnetic impulses by the driver and transmitted via a loop aerial. This magnetic signal is picked up by the telecoil within hearing aids and converted back to speech. Clever stuff!

1 to 1 Hearing Loops

1 to 1 hearing loops enhance customer service by improving accessibility

1 to 1 hearing loops are perfect for use at counters or in situations where interaction between two people takes place, allowing your customers to engage with your staff freely.

A hearing instrument in “normal mode” amplifies all sounds, including background noise. This can make it very tricky for those with reduced hearing to distinguish recordings, speech or conversation in busy environments. 1 to 1 hearing loop systems overcome this problem.

With a hearing loop, speech is picked up through a microphone, converted to magnetic impulses by the driver and transmitted via a hearing loop aerial. This magnetic signal is picked up by the telecoil within the hearing instrument and converted back to speech, allowing your customers to interact with staff or listen to pre-recorded audio freely.

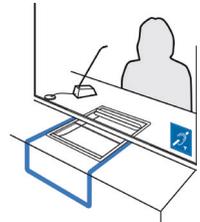

The above and below counter loops are controlled by our sleek and unique hearing loop driver, offering customers and staff crystal clear sound reproduction and efficient management of power consumption.

Large Area Hearing Loops

Large area loops enhance the customer experience by improving accessibility

Large area loops allow multiple hearing instrument wearers to hear music and speech with complete clarity. Whether in a small meeting room, a classroom, or even a sports stadium, we can install discreet large area hearing loops to your specification.

At Contacta we do things differently. Our talented team design innovative and customer-centric hearing loop drivers, which use the latest Class D and DSP technology to offer superior quality sound reproduction for both speech and music. The technology we put inside these drivers means there is no sound distortion (with a correct installation), guaranteeing the best performance for the end user.

Every room is different. We specify loops in a unique way, taking into account the use, make up and size of each room to ensure that your customers get the best listening experience. Without proper installation, even the best loop driver will not perform to its best so we highly recommend that you get in touch with us and we can recommend the perfect way to install your loop.

Tape Options

These adhesive tapes are designed for use during the installation of large area hearing loop systems

They are used to cover copper tape or cable either under or above flooring, to provide protection to the cables and secure them firmly onto the installation surface.

Tapes are available in three colours, to help clearly distinguish between different loop cables in multi-loop layouts such as phased array installations.

After installation is complete, "Do Not Cut" warning tape should be laid over loop cabling to warn against damage to the system.
